Excerpt from Clinical and Pathological Papers From the Lakeside Hospital, Cleveland, 1901 Professor of Medicine, Western Reserve University; Visiting Physician to The Lakeside Hospital. The deformities of the body are so marked a feature in rickets that attention has always been directed to the bones as the essential parts affected. Rickets is, however, a disease which concerns the general system; the nutrition, growth, and development of all the growing organs are involved. The muscles are atrophy and weak. The striae of the voluntary muscles are feebly marked and often exceedingly difficult to make out. The muscle is pale and in advanced cases degenerated. The ligaments are relaxed. The body in consequence thereof is not well supported, as evidenced in the joints, and especially in the changed form of the spinal column. The spine bends backward in a large full curve, loses its firmness and cannot sustain the upper part of the trunk and head. Secondary curves, lateral and forward, come in persisting disease and are sometimes due to bone involvement. The great convexity seen in early cases is due to the relaxation of the spinal ligaments. The weakness of these soft tissues is responsible for some of the changes in the deformities of the chest. The intercostal muscles become so feeble that they fail to lift the ribs and when the patient has a pulmonary complaint that compels him to cough, the lower part of the chest is pressed inward and crowds on the intrathoracic space. The lower part of the chest is supported by the viscera and caves in. This makes the curves on the chest seen in early rickets, especially when the subject has had...
